SCI Assignment

MWA and SCI Analogy

MWA is an application that incorporates frameworks (AngularJS, Angular, and Express), platforms (NodeJS), and NOSQL database (mongoDb). These applications are fast and scalable which are written using event-driven programming language called JavaScript. JavaScript programs have no 'main'. They respond to user actions called events.

SCI: As JavaScript was designed as a language that could effectively respond to browser and DOM events, we respond most effectively to events in our environment if our awareness is settled and alert. We can achieve this capability using the effortless technique called Transcendental Meditation.

NodeJS manages tasks to be done asynchronously!

The **asynchronous** global methods **setTimeout** and **setInterval** take a function reference as an argument and then **callback** the function at a specified time.

 Science of Consciousness: Accepting an assignment and carrying it out at a designated time is a fundamental capability required for intelligent behavior. A clear awareness and mind promote good memory and the ability to successfully execute tasks.

Thank you,

Mesgan
